Abstract

- rising importance of Bitcoin (market cap comparable to large multinational companies such as Facebook and Tesla) - volatility higher than stockmarket, different asset - Bitcoin price prediction offers trader advantage over non-rational traders - here: focus on classification of Bitcoin price (up or down) - techniques:

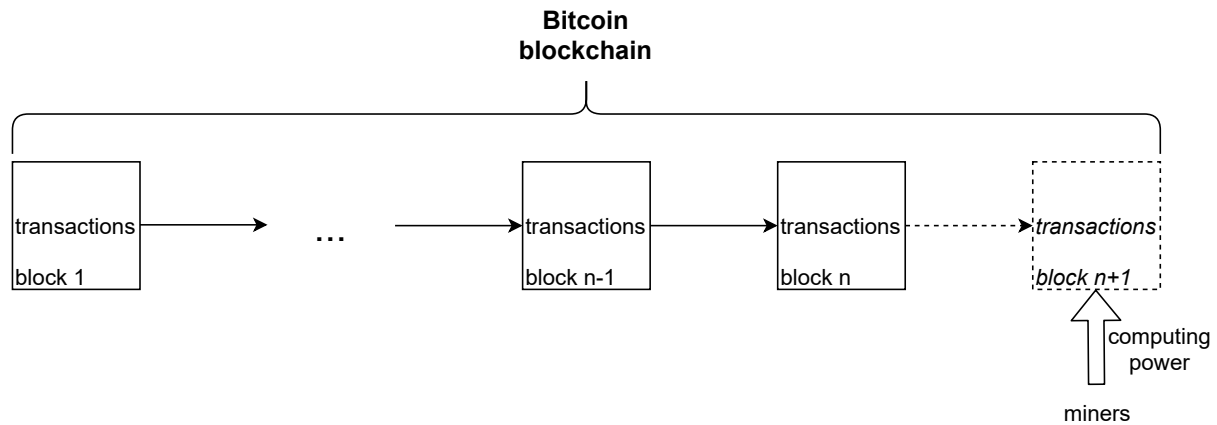

Figure 1: This is a simplified visualization of the Bitcoin blockchain.

1 Introduction

- cryptocurrency from 2009 developed by an unknown individual or group under pseudonym Satoshi Nakamoto [1] - currently cryptocurrency with largest market cap of 750 billion, comparable to market cap of companies like Facebook or Tesla [2] [3] - one hand: classical asset with price driven by demand and supply, can be traded on exchanges (like stock exchanges) - other hand: where do they come from? -> blockchain, can be mined using computational resources via process called hashing, block size
 - so far: classification accuracies of 51-55 percent - here: comparison of

2 Dataset & Definitions

- data taken from Blockchain.com API [4] - features: classical asset data & Bitcoin specific data - in total 3576 days for all the features

3 Theory

4 Implementation & Software

5 Results

6 Discussion

7 Conclusion & Outlook

Outlook: - Google searches [5], Twitter [6] - consider individual transactions [7] - predict major crashes [8] [9] [10]
